# **Homework 5: Inheritance**

In this homework, you are to implement the class hierarchy shown in the below diagram where Circle and Rectangle are subclasses of Shape class and Square is a subclass of Rectangle class.

# #color:String #filled:boolean +Shape() +Shape(color:String,filled:boolean) +getColor():String +setColor(color:String):void +isFilled():boolean +setFilled(filled:boolean):void +getArea():double +getPerimeter:double +toString():String

### Circle

### #radius:double

- +Circle()
- +Circle(radius:double)
- +Circle(radius:double,
  - color: String, filled: boolean)
- +getRadius():double
- +setRadius(radius:double):void
- +getArea():double
- +getPerimeter():double
- +toString():String

## Rectangle

#width:double
#length:double

- +Rectangle()
- +Rectangle(width:double,length:double)
- +Rectangle(width:double,length:double,
  - color: String, filled: boolean)
- +getWidth():double
- +setWidth(width:double):void
- +getLength():double
- +setLength(legnth:double):void
- +getArea():double
- +getPerimeter():double
- +toString():String

- +Square()
- +Square(side:double)
- +Square(side:double,color:String,
  - filled:boolean)
- +getSide():double
- +setSide(side:double):void
- +setWidth(side:double):void
- +setLength(side:double):void
- +toString():String

- Write an abstract superclass called Shape (as shown in the class diagram), which contains:
  - ◆ Two instance variables color (String) and filled (boolean).
  - ◆ Two constructors: a no-arg (no-argument) constructor that initializes the color to "red" and filled to true, and a constructor that initializes the color and filled to the given values.
  - ◆ Getter and setter for all the instance variables. By convention, the getter for a boolean variable xxx is called isXxx() (instead of getXxx() for all the other types).
  - ◆ A toString() method that returns "A Shape with color of xxx and filled/Not filled".
  - ◆ Two abstract methods getArea() and getPerimeter().
- Write two subclasses of Shape called Circle and Rectangle, as shown in the class diagram.
- The Circle class contains:
  - ◆ An instance variable radius (double).
  - ◆ Three constructors as shown in the diagram where the no-arg constructor initializes the radius to 1.0
  - Getter and setter for the instance variable radius.
  - ◆ Methods getArea() and getPerimeter().
  - ◆ Override the toString() method inherited, to return "A Circle with radius=xxx, which is a subclass of yyy", where yyy is the output of the toString() method from the superclass.
- The Rectangle class contains:
  - ◆ Two instance variables width (double) and length (double).
  - ◆ Three constructors as shown in the diagram where the no-arg constructor initializes the width and length to 1.0.
  - Getter and setter for all the instance variables.
  - ◆ Methods getArea() and getPerimeter().
  - ◆ Override the toString() method inherited, to return "A Rectangle with width=xxx and length=zzz, which is a subclass of yyy", where yyy is the output of the toString() method from the superclass.
- Write a class called Square, as a subclass of Rectangle. Convince yourself that Square can be modeled as a subclass of Rectangle. Square has no instance variable, but inherits the instance variables width and length from its superclass Rectangle.
  - Provide the appropriate constructors (as shown in the class diagram). Hint: public Square(double side) { super(side, side); // Call superclass Rectangle(double, double)
  - ◆ Override the toString() method to return "A Square with side=xxx, which is a subclass of yyy", where yyy is the output of the toString() method from the superclass.
  - Override the setLength() and setWidth() to change both the width and length, so as to maintain the square geometry.
- Write ShapeDemo class which contains a main method (the only static method in your project) to test your classes. In the main method

- Create an instance of Circle class and assign it to a Shape typed variable such as "Shape circle = new Circle..."
  - Print the string representation of the instance
  - Print the area and perimeter of the circle instance
- Create an instance of Rectangle class and assign it to a Shape typed variable such as "Shape rect = new Rectangle..."
  - Print the string representation of the instance
  - Print the area and perimeter of the rectangle instance
- Create an instance of Square class and assign it to a Shape typed variable such as "Shape sq= new Square..."
  - Print the string representation of the instance
  - Print the area and perimeter of the square instance

Due date: 07.03.2016 13:30

### **Submission:**

- You will submit your homework to **onurkilincceker@gmail.com**
- Write CENG 1004 HW5 in the subject line of your email.
- To this email, you should attach your compressed deliverable file (zip file) which contains the source files of your application.
- The name of your zip file should be in the following format: StudentID\_HW5.zip and you should replace StudentID with your own ID number. Assuming 1007090002 is your ID number, then the name of your zip file should be 1007090002 HW5.zip
